Defining Internet Content Regulation

"Internet content regulation" will be defined as any sort of widespread content restriction or monitoring as mandated, either explicitly or otherwise, by government or regulatory bodies

The Internet: From a Regulatory Perspective

Which countries regulate Internet content?

According to RWB's definition, ~60 countries experienced some sort of Web censorship in 2009, up from 30 in 2008.

Complete Control

- Burma (Myanmar)
- Cuba
- North Korea
- Turkmenistan

Substantial Control

- China
- Egypt
- Iran
- Uzbekistan
- Syria
- Tunisia
- Vietnam

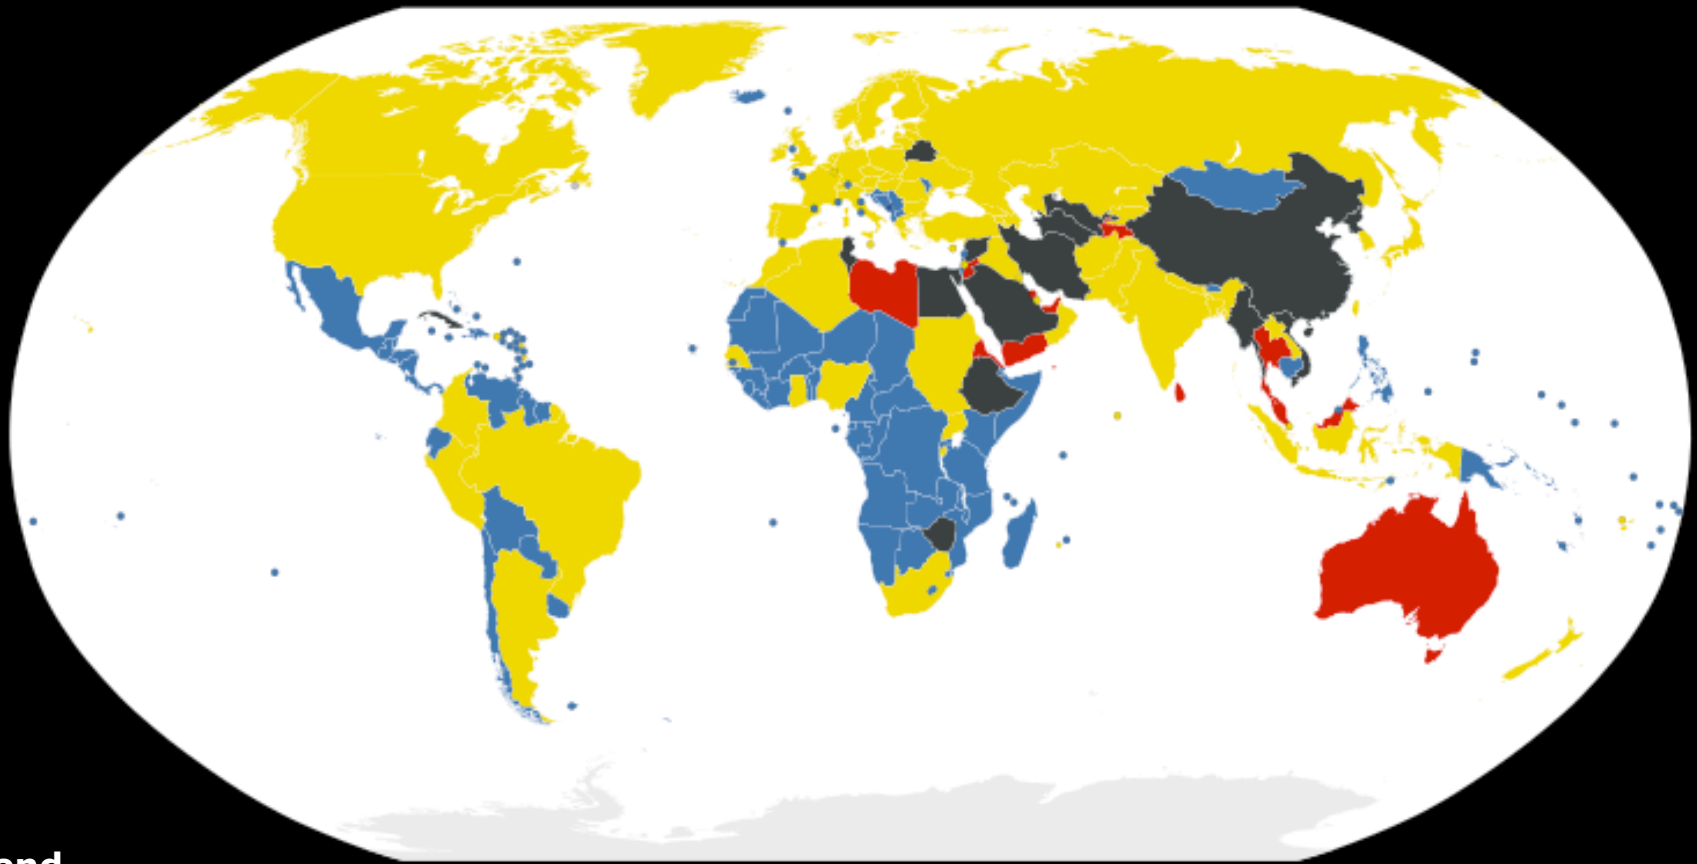

Moderate Control

- Australia
- Bahrain
- Belarus
- Eritrea
- Malaysia
- Pakistan
- Russia
- Singapore
- South Korea
- Sri Lanka
- Thailand
- Turkey
- United Arab Emirates

Partial Control

- Brazil
- Canada
- Czech Republic
- France
- Germany
- Indonesia
- Italy
- Japan
- ...
- New Zealand
- Pakistan
- Poland
- South Africa
- Spain
- United Kingdom
- United States

Which countries regulate Internet content?

Legend

Reporters without Borders, August 2009

Unknown

No censorship

Some censorship

Under surveillance

Heavy surveillance

Why regulate the Internet?

How is the Internet regulated?

Four Primary Modes - Lawrence Lessig

Creates virtual marketplace of information; offline laws of supply and demand reflected online

Markets

Norms

Offline social norms translate into online scenarios

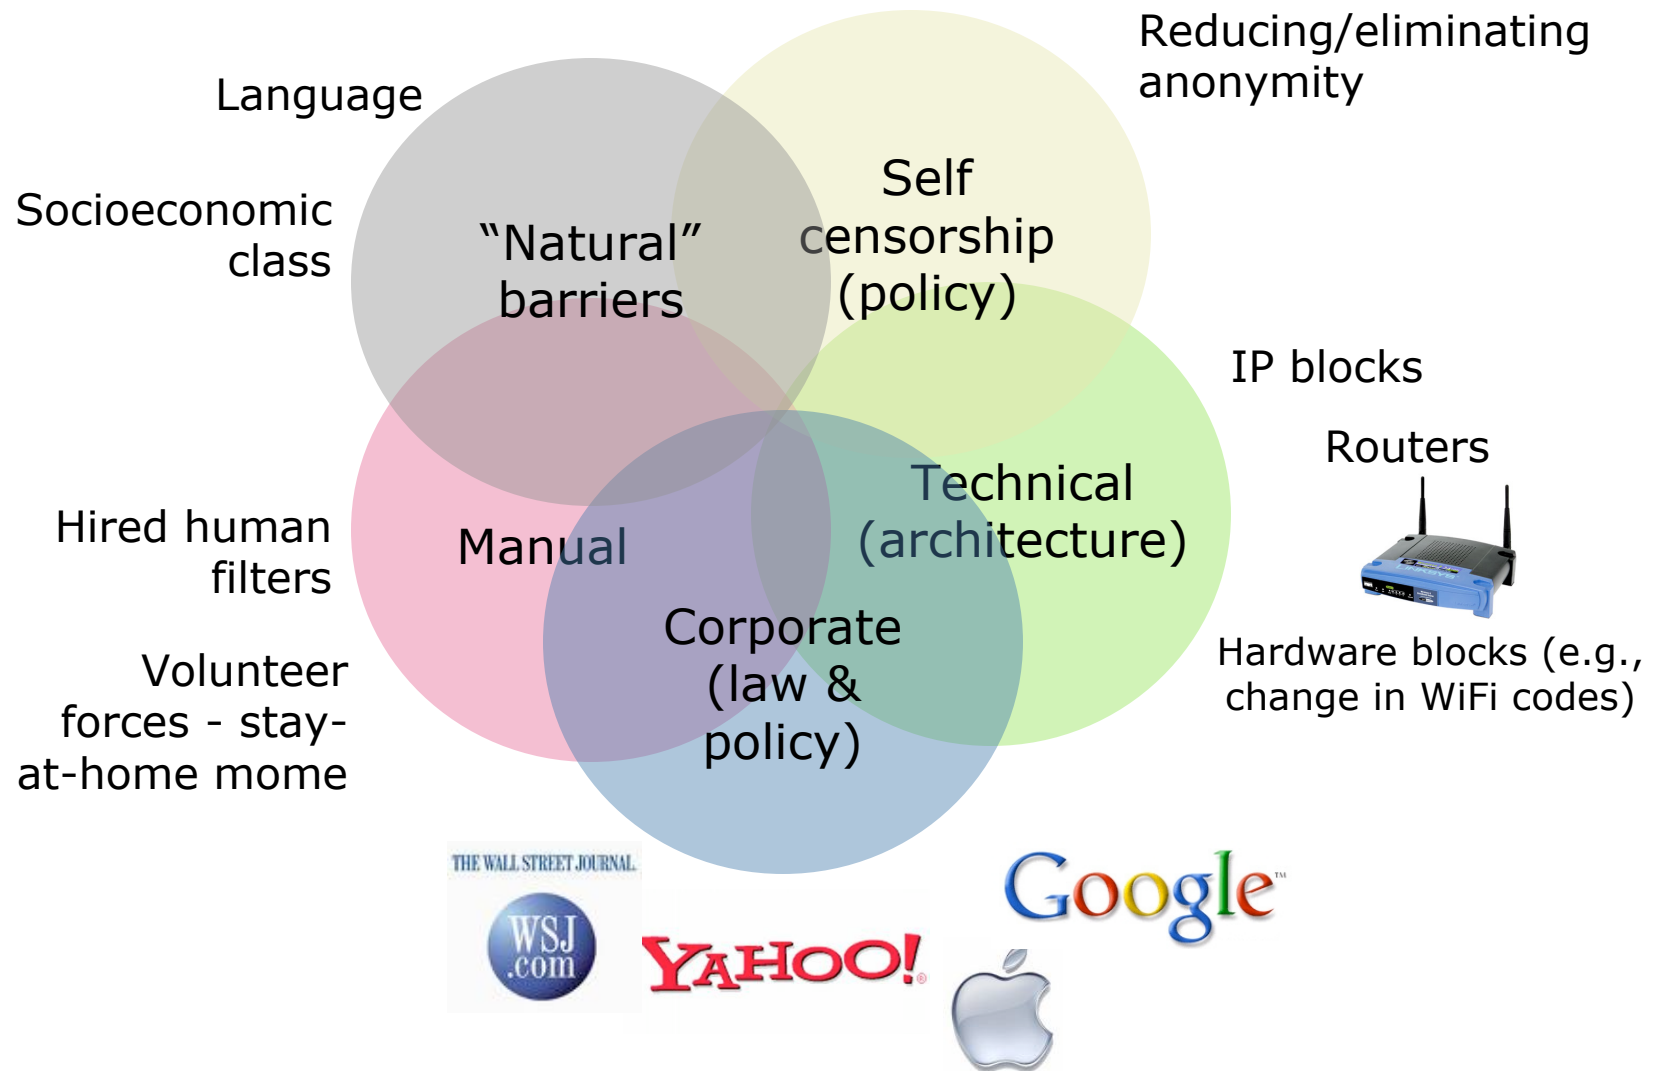

*"East Coast Code"
Offline legal terms apply to online situations*

Law

Architecture

*"West Coast Code":
Primarily technical means of regulating data*

How is the Internet regulated?

Where can the Internet be regulated technically?

Internet backbone	State-directed implementation of national content filtering schemes and blocking technologies affecting Internet access across entire backbone -- often done at "international gateway"
Internet service providers (ISPs)	Government-mandated filtering is most commonly implemented by Internet Service Providers (ISPs) using methods such as search result removals, take-downs, or technical blocking.
Institutions	Filtering of institutional level networks using technical blocking and/or induced self-censorship occurs in companies, government organizations, schools and cybercafés.
Individual computers	Home or individual computer level filtering can be achieved through the installation of filtering software that restricts an individual computer's ability to access certain sites.

Where can the Internet be regulated technically?

An example - Internet backbone

Case Study | China

Population: ~1.34 billion (June 2009 est.)

Users Online: 384 million (29% of total population) - over 90% have broadband access

Level of online regulation: Very high

Credit: Associated Press

Regulation Filter Type	Degree of use	Examples
"Natural" barriers	Moderate	Articles critical of Chinese government published only in English/French; publications allowed only for certain socioeconomic groups
Technical	High/Pervasive	Sophisticated filters used to block potentially offensive sites by re-routing IP addresses; "Green Dam Youth Project"
Manual	High/Pervasive	Human censors will regularly comb forums and blogs to eliminate any offensive material
Corporate	High/Pervasive	Chinese government request cooperation of corporations such as Yahoo and Google as part of doing business in China
Self-censorship	High/Pervasive - Moderate	Uses selected, publicized arrests as a means of deterring potential offenders

Case Study | China

Population: ~1.34 billion (June 2009 est.)

Users Online: 384 million (29% of total population) - over 90% have broadband access

Level of online regulation: Very high

Credit: Associated Press

WHY IT MATTERS

- China has the largest and fastest growing Internet population in the World
- Filtering is random and reasons not often transparent (e.g., sites like YouTube will be available one day and down the next)
- There had once been the belief that Internet would kill the censorship practices of the CCP
- Acting as an example for many other states (e.g., Iran)
- Going forward, there is an acute awareness amongst Chinese leadership to improve “soft power” by way of global public relations

“The question is no longer how the Internet will affect China. It is how China will affect the Internet.”

- Professor Peter Yu, Drake University Law School

Case Study | Iran

Population: 66,429,284 (July 2009 est.)

Users Online: 32,200,000 (48.5% of total population)

Level of online regulation: Very high

Credit: Wikipedia

Filter Type	Degree of use	Examples
"Natural" barriers	Low	
Technical	High/pervasive	Increasing reliance on Iranian-developed ISPs that do not use Western technologies. Heavy surveillance continues to be widely practiced. All public Internet traffic is routed through proxy servers.
Manual	High/pervasive	The Iranian Revolutionary Guard protects Internet content standards; blogs written as part of the Iranian parliamentary voluntary force (comparable to China's "fifty-cent" army)
Corporate	Moderate	Incidents where companies that sell mobile infrastructure network must also share how to monitor content (ex: Nokia)
Self-censorship	High/pervasive	Revolutionary Guard and arrests deter certain online behaviors

Case Study | Iran

Population: 66,429,284 (July 2009 est.)

Users Online: 32,200,000 (48.5% of total population)

Level of online regulation: Very high

WHY IT MATTERS

- Iran has one of the most regulated Internet censorship regimes despite being one of the Internet's largest proponents (second country in the Middle East to go online, first was Israel)
- History of using Internet as a political and social intermediary
- First "Twitter" revolution - Twitter delayed updates to site during election
 - Significance of this is multi-fold:
 - Gave journalists access they were otherwise denied
 - Publicized "Neda"

Case Study | Iran

Copyright © 2009 Creators Syndicate

Case Study | France

Population: 64,057,792 (July 2009 est.)

Users Online: 43,100,134 (69.3% of total population)

Level of online regulation: Low-Moderate

Credit: Wikipedia

Regulation Filter Type	Degree of use	Examples
"Natural" barriers	N/A	
Technical	High/pervasive	State-run computer trojans and requires ISPs to block certain sites on the government's blacklist
Manual	N/A	
Corporate	N/A	
Self-censorship	High/pervasive	Laws will allow for new database of citizen online activity

Case Study | France

Population: 64,057,792 (July 2009 est.)

Users Online: 43,100,134 (69.3% of total population)

Level of online regulation: Low-Moderate

Credit: Wikipedia

WHY IT MATTERS

- One of the first countries involved in cyber-related regulation cases
- One of the most regulated democratic governments in terms of online regulation
- Current legislation goes against long-standing privacy initiatives
- May be an example for other states in the region, particularly Germany

Policy

- How should governments regulate social content? Is online truly an extension of offline social interactions and norms?
- Is an Orwellian approach ever justified?
- Can policy reflect the preferences of its citizens?
- How can policy work with commerce and individuals to maximize social welfare?
- There are generally two camps of thought -- those who call for a completely free and open net and those who call for some regulation WHEN protecting certain social values

Policy

A case for country-based regulation and policy:

Suppose there are three nations each with 100 people. 51 want to ban online gambling in nation A, 75 want to ban in nation B, and 30, want to ban in nation C.

Global Regulation: 144 unhappy with policy, 156 happy with policy.

Country-based regulation: Nation A: Ban; Nation B: Ban; Nation C: Permit

Total: 196 happy with policy, 104 unhappy with policy

Public response

- Even in countries where government regulation is heaviest, there is a massive wave of tools aimed at circumventing these barriers

Some tools:

VPNs: Virtual private networks are especially popular in China, where 10 known foreign ones are widely used. Have rarely been shut down

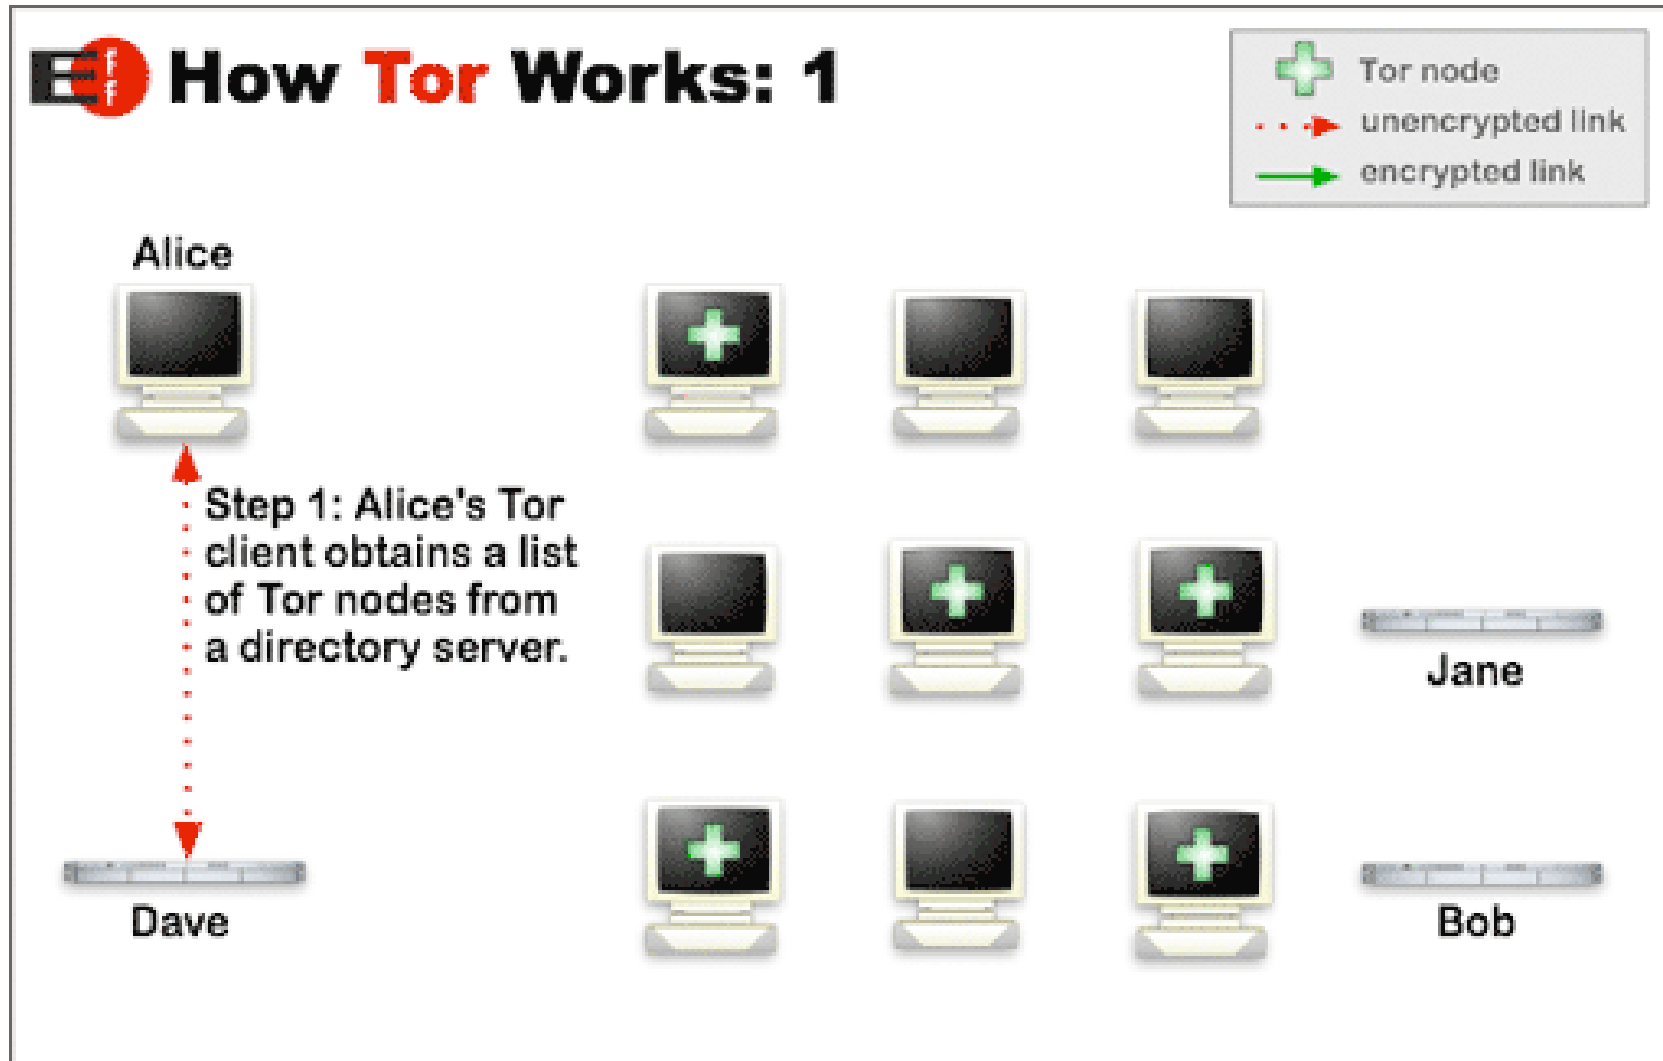

Proxies that act as an intermediary between user's computer and end site

Webplatforms like **Tor** aim to protect users identity by erasing tracks of where users have been

Renewed my VPN last night, I'm ready for another
[#harmonious](#) year in China.

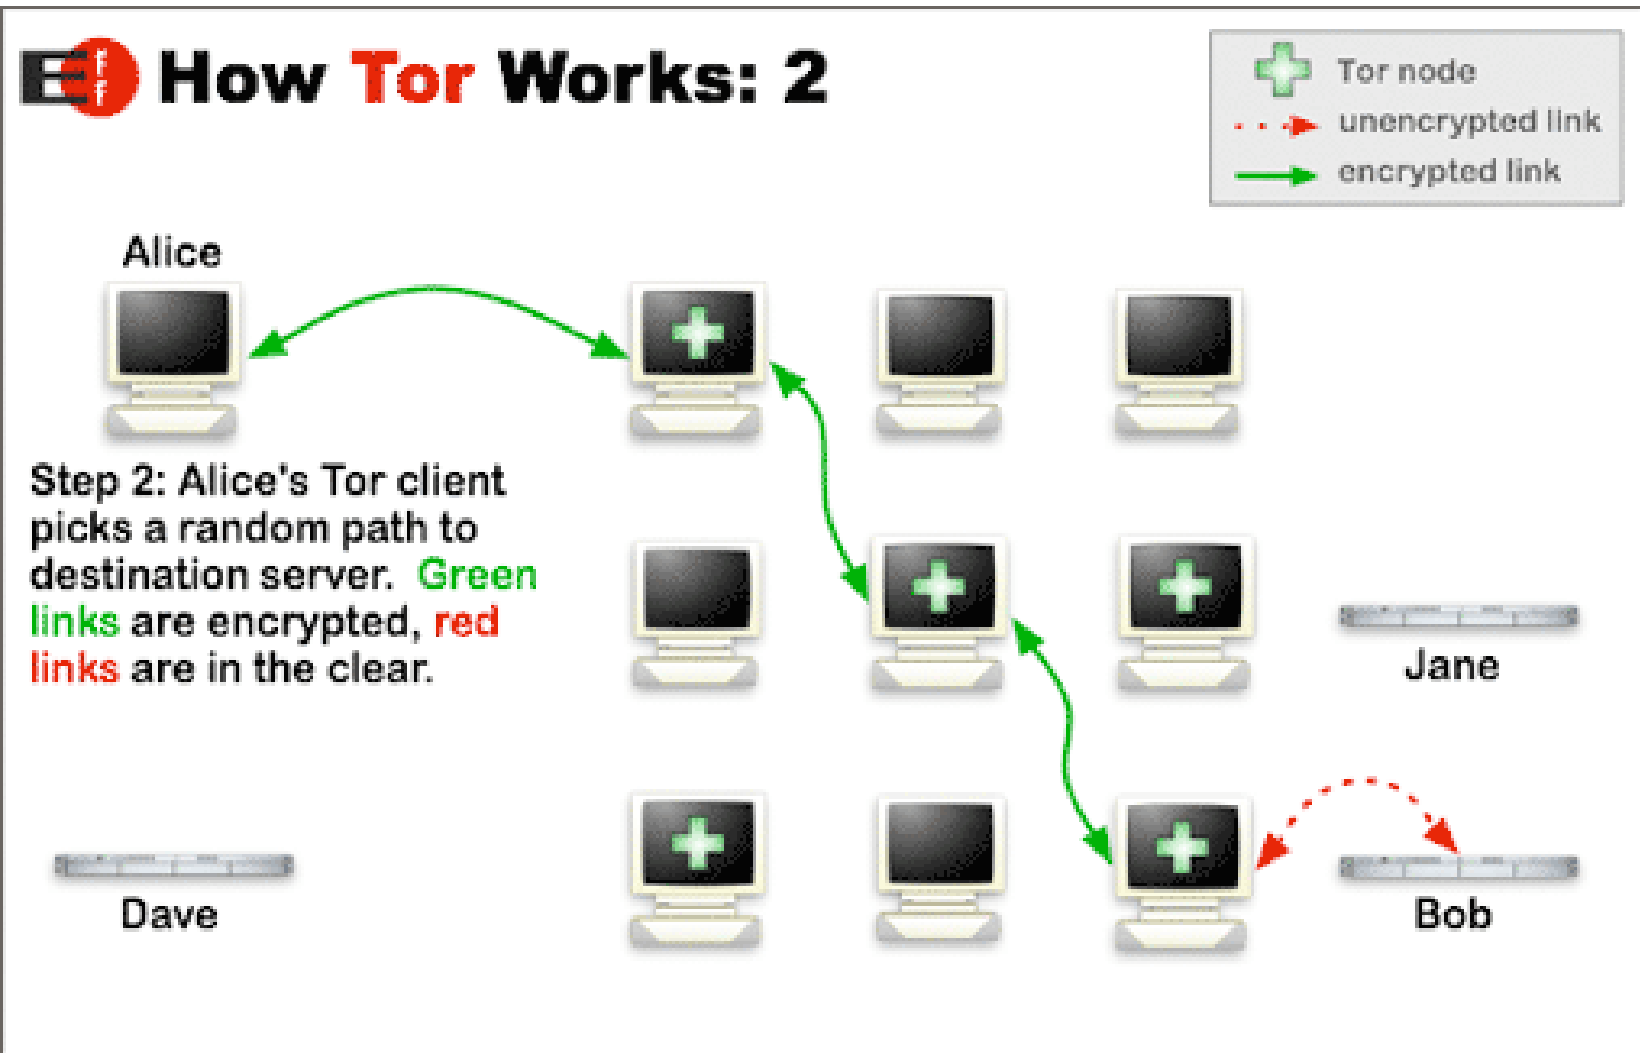

7:24 PM Mar 15th via TweetDeck

How Tor Works

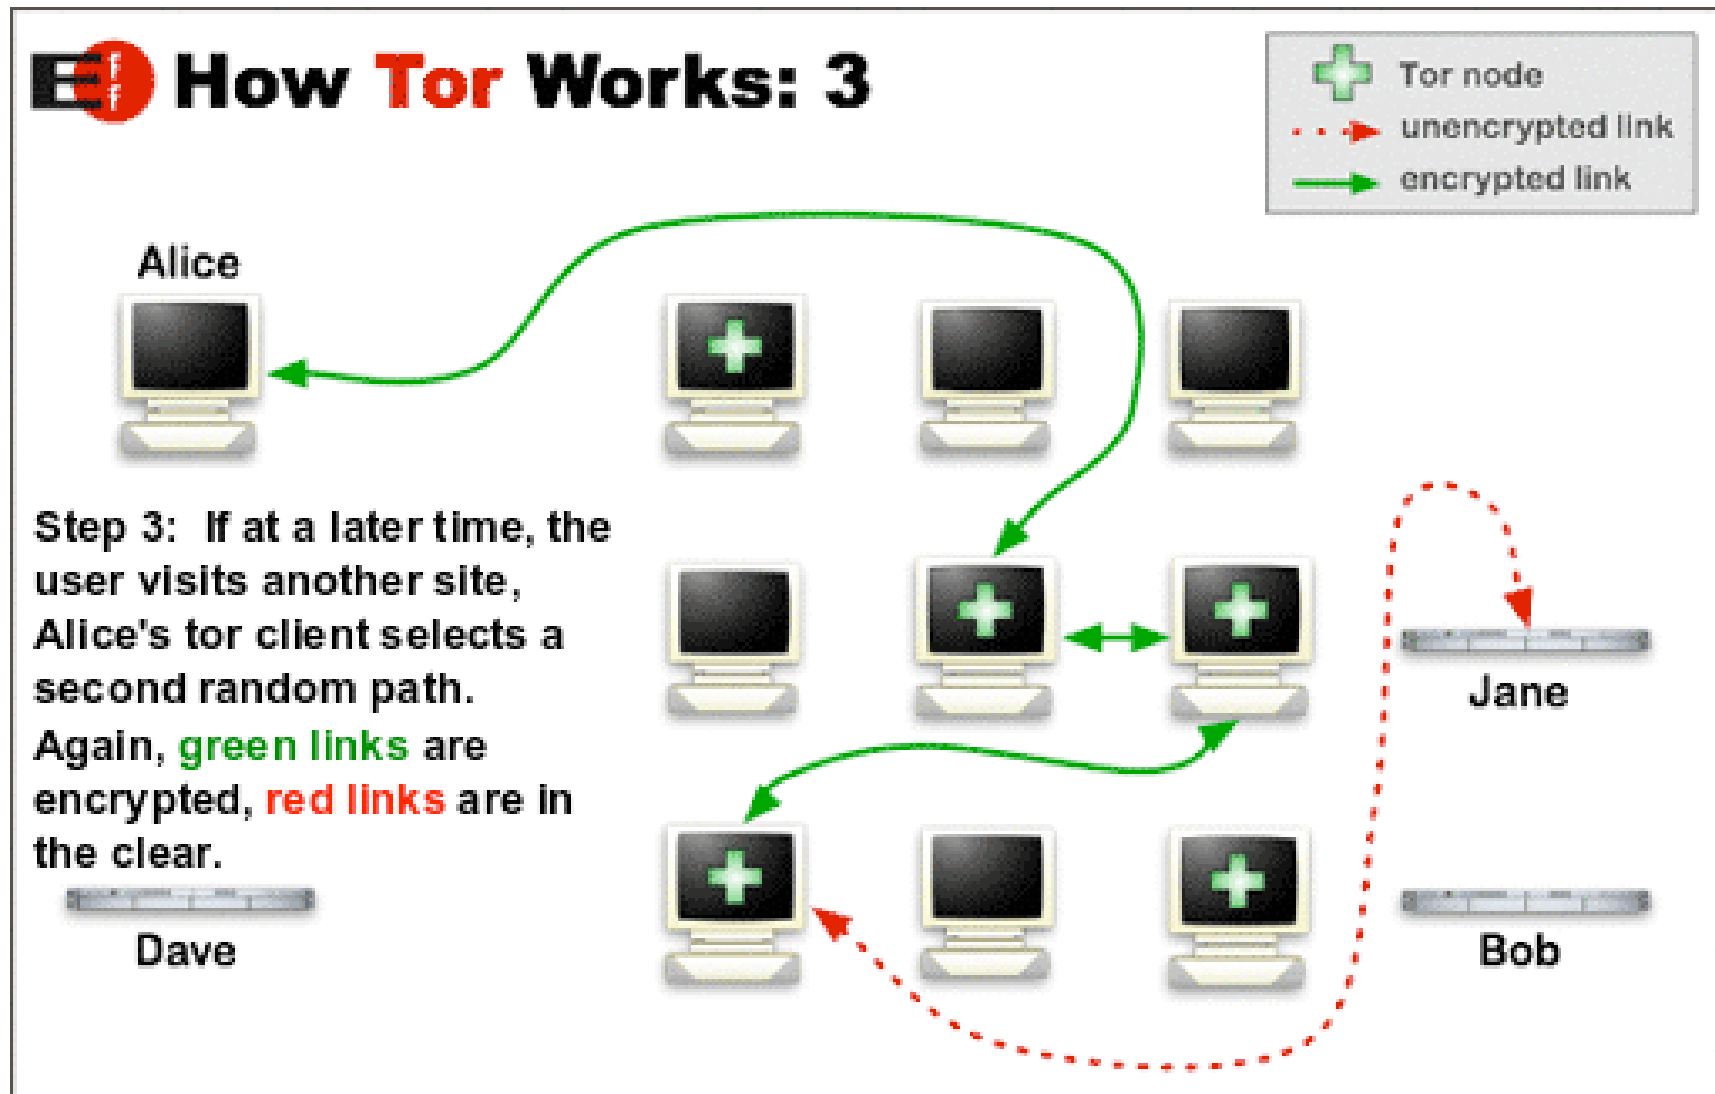

How Tor Works

How Tor Works: 2

How Tor Works

Economic implications

Trade barriers: Just as in offline markets, government regulation can result in trade barriers (e.g., protection of domestic Internet firms in China)

Black markets: Emergence of Internet usage in areas like the North Korean/Chinese border through Web-enabled phones running on Chinese services

Legal Implications

How are borders defined? Do we define border based on where the technology company is headquartered? Where servers are hosted? Or where the end user is?

Redefining of “market power” How can one government’s laws reflect new business practices? (*Example:* Microsoft dot-net-passport security and EU global privacy standards)

What are the effects?

- **Global village?** Early pioneers of the Internet we know today and many human rights groups see the Internet as an open space, a place of open information and self-governance
- Reality is oftentimes an amplification and **reflection of offline societies** and values
- Technologists like Bill Gates had proudly predicted the advent of “**unlimited broadband**” by 2010; today, we find quite the opposite - often limited not by network capabilities but by nation states
- In a borderless world, the issue of **borders** becomes more important than ever - where does the jurisdiction of one country begin and end?
- The number of nations implementing regulatory measures is increasing. Google cites that more than 25 governments have blocked its services since its inception, especially after 2002.
